

Light-Electric-Vehicles

Gwangju Korea ExCo Meeting 2nd of May 2015
Hannes Neupert / Operating Agent IEA HEV IA Task 23 LEV Parking & Charging infrastructure
Update on selected Activities 2014/2015

Planned output of the task 23: Create public procurement templates to purchase:

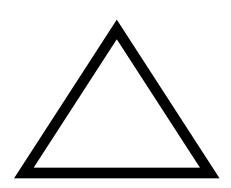

- A) public parking facility infrastructure
- B) pedelecs as part of public transport system

Environment of task 23:

IEA Task 23
Defining requirements
Creating joint public procurement of Infrastructure
and Public LEV mobility solutions

IEC/ISO/TC69/JPT61851-3
Creating the harmonized standards for LEV parking and charging infrastructure

Industry producing LEV parking and charging infrastructure as wella LEV mobility vehicles according to the Task 23 requirements and the IEC/ISO/TC69/JPT61851-3 standards ³

Past and future result milestones of task 23:

2010 Mandate 468 of EU on EV infrastructure

2011 First discussion at EXCO at Portugal

2013 Official launch task 23

2014 Definition of the key standard content

2015 first working prototypes and pre production

2016 Trial projects in several countries

2017 first procurement projects and large scale applications

2018 mass production and refining of business model to

allow as well profitable application in rural areas

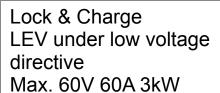

Only Lock and Park No electricity necessary

Lock & Charge Large LEV utilizing the 3rd pin and charging at 120V, 60A with up to 6kW

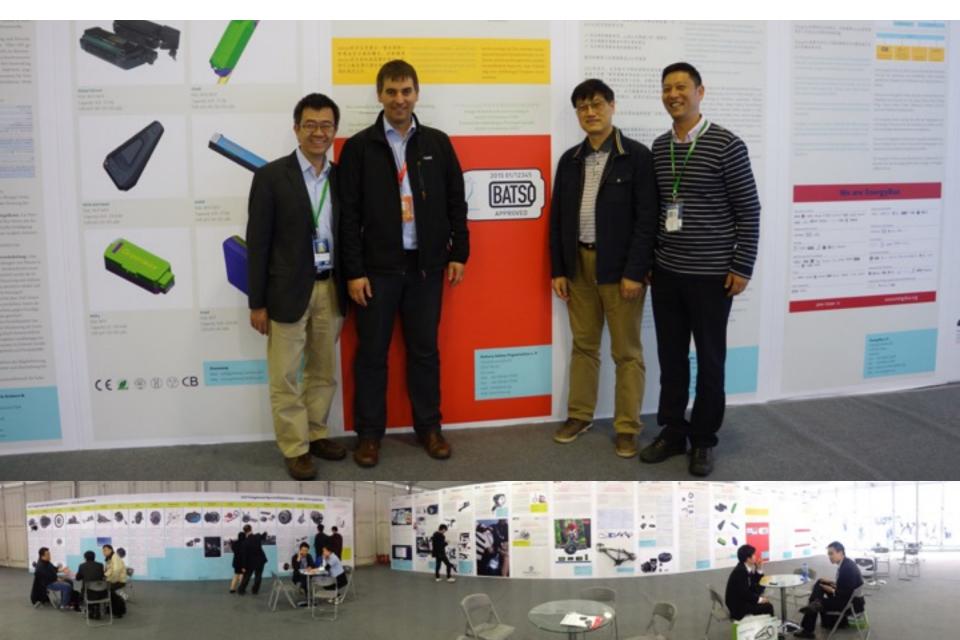

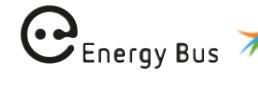

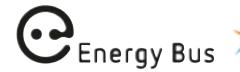

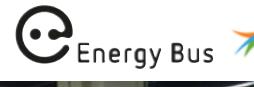

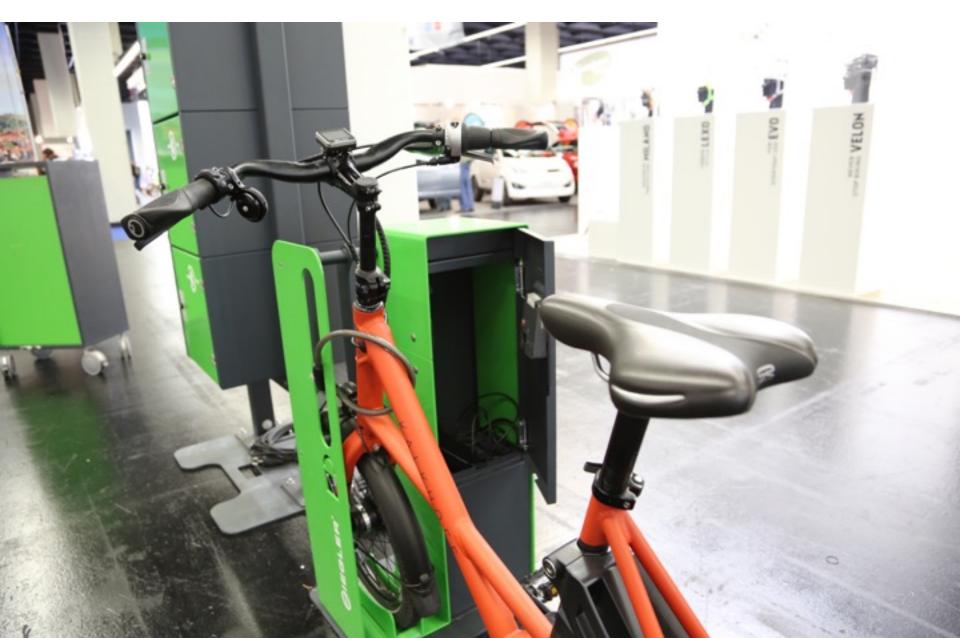

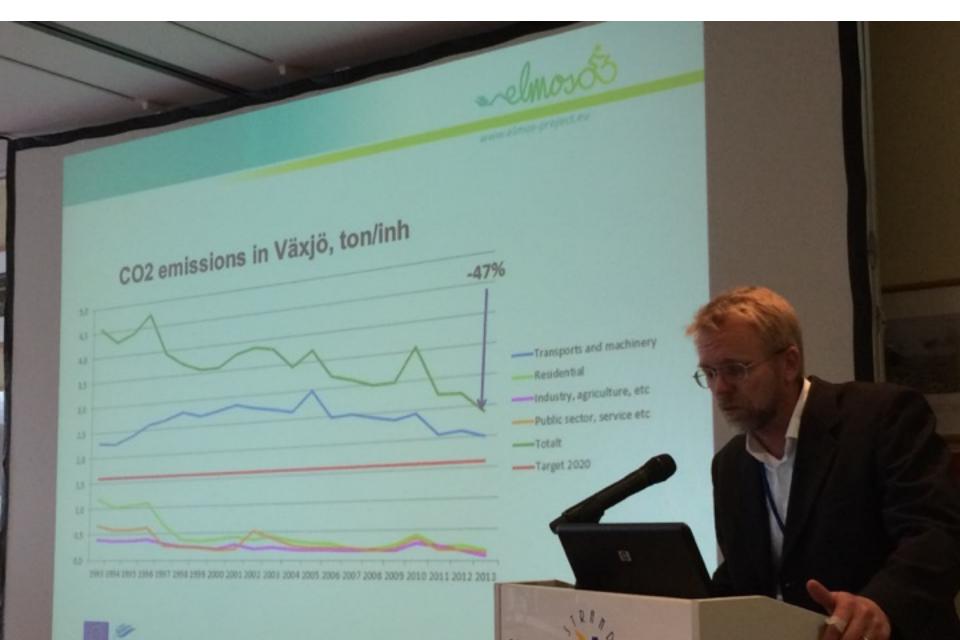

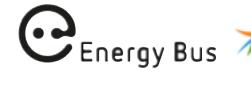

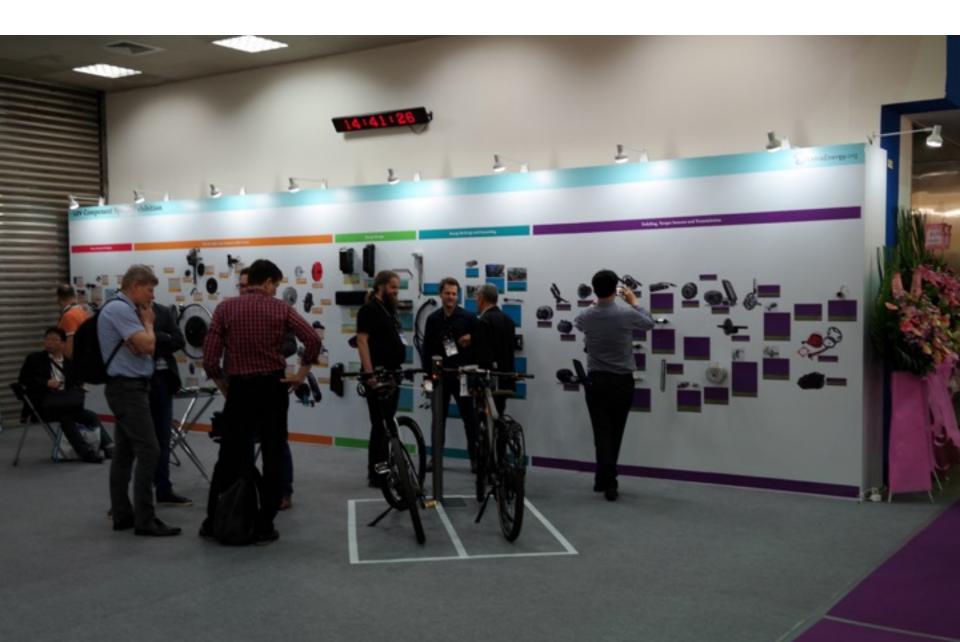

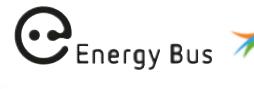

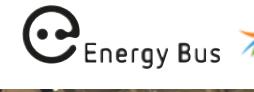

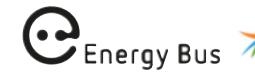

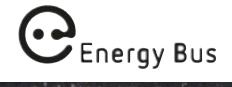

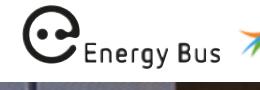

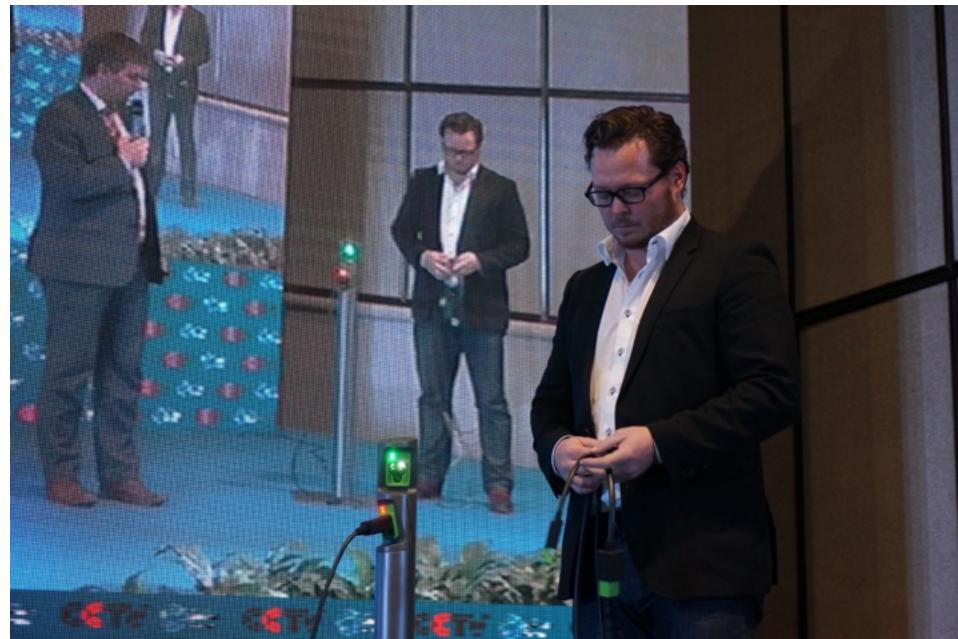

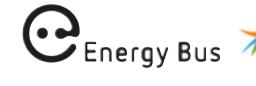

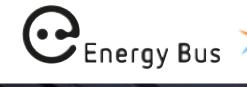

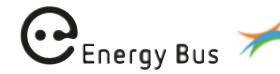

Activities Task 23 2014/2015

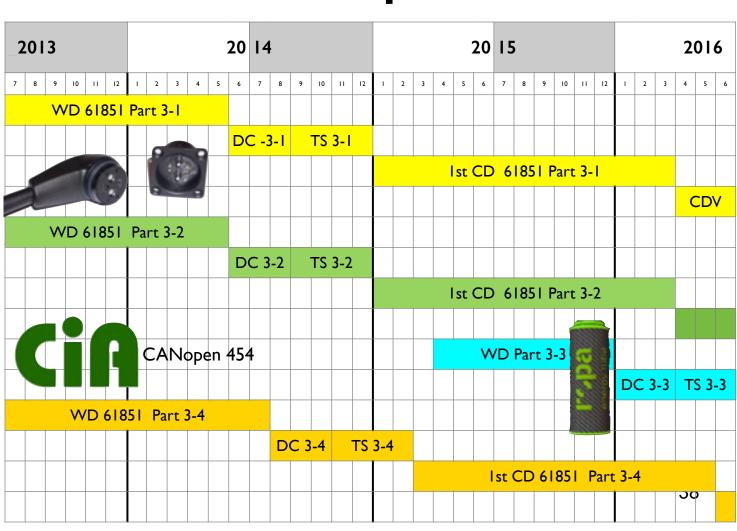

Standardization roadmap:

WD 61851: Part 3-1 General Requirements for Light Electric Vehicles (LEV) AC and DC conductive power supply

WD 61851: Part 3-2 Requirements for Light Electric Vehicles (LEV) DC off-board conductive power supply systems

WD 61851 Part 3-3: Requirements for Light Electric Vehicles (LEV) battery swap systems

> WD 61851 Part 3-4: Requirements for Light Electric Vehicles (LEV) communication

The game changer tech advances down the road:

6) Public space management for the non moving LEV traffic. As practiced today in most japans cities to provide quality pedelec parking facilities could become a business for the cities as well for privat entities in the moment wild unlimited public parking of two wheelers is banned. This would remove the worry about range since every-time a pedelec is parked it is plugged in for charging. Rule is that electricity is free of charge and the return of invest should only be made by charging the user timebase for the parking. This parking and charging interface is part of the Standardization process within the IEC/ISO/TC69/JPT61851-3-2 activities.

Only Lock and Park
No electricity necessary

Lock & Charge LEV under low voltage directive Max. 60V 60A 3kW

Lock & Charge Large LEV utilizing the 3rd pin and charging at 120V, 60A with up to 6kW

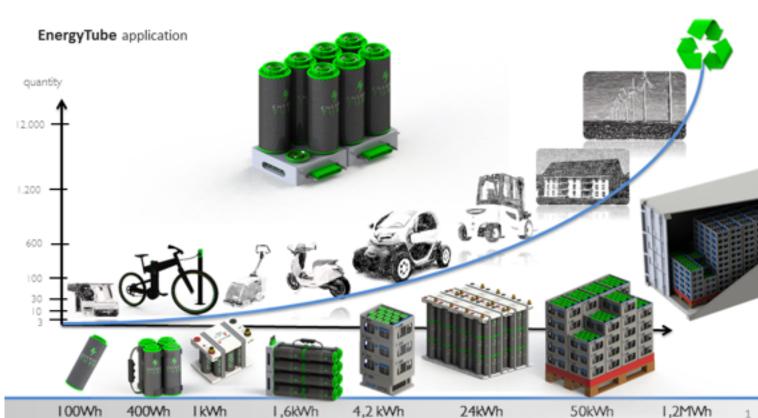

The game changer tech advances down the road:

5) Standardized energy storage containers which are only payed by use, and which are universal in the application. Which will release the user from the initial investment into the energy storage devices as well in the worries on the natural degradation and necessary replacement during their lifetime. See more at: www.EnergyTube.de It is as well part of the Standardization process within the IEC/ISO/TC69/JPT61851-3-3 activities.
